Structure and sequence of the cellular gene homologous to the RSV src gene and the mechanism for generating the transforming virus (211 32 (3), 881-890 (1983)
8315564
[2] reports the sequence of c-src without its introns and includes the following table of the predicted splicing junctions based upon the structural similarity between c-src and v-src.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LLLNPENPRGTFLVRESETTKGAYCLGYSDFDNAKGLNVKHYKITKLDSGGFYTTSRT

This particular recovered ASV is known to be derived from a transformation defective deletion mutant of Rous sarcoma virus Schmidt-Ruppin strain, subgroup A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    c-myc proto-oncogene; env protein; src oncogene.
RASV1441 (recovered avian sarcoma virus 1441; derived from td
mutant of Rous sarcoma virus Schmidt-Ruppin strain, subgroup A)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A recovered avian sarcoma virus is a virus which has regained

M21526.1 GI:210264
Iong terminal repeat (LTR); p66-src protein; src oncogene.
Rous sarcoma virus (strain PR-C, replication-defective mutant PR2257) RNA, passed in quail embryo fibroblast cell line C7.
Rous sarcoma virus
Viruses; Retroid viruses; Retroviridae; Avian type C retroviruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 (bases 1 to 4413)

present sequence encodes human SAD. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the
                                                                                                                                                                                              ö

A brk (breast tumor kinase) CDNA fragment was used to screen a CDNA increase tumor cell line T-47D.

CDNA library propared from human breast tumor cell line T-47D.

CDNAs were isolated. The slightly longer clone lambda-t2 (Q81189) encoded brk, which was identified as a novel putative non-receptor kinase of use as a prognostic/diagnostic of breast tumour metastasis, Sequence 2507 BP; 48 R, 726 C; 809 G; 514 T;

                                                                                                                                                                                                                                                                                                                                                                                                 cell migration, urokinase-type plasminogen activator activity, and reduced monourclear cell adhesion and fibronectin prodn The DNA encoding a portion or (more preferably) the entire pp60 c-src polypeptide is used to transform endothelial cells. Transformed cells produce increased amounts of pp60 c-src and have improved therapeutic properties. They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have be used to improve the success of surgical procedures such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   873 agtggccataaagactctgaagcccggcaacatgtccccggaggccttcctgcaggaagc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genetically engineered endothelial cells - which exhibit enhanced T cell migration, urokinase type plasminogen activator activity, and reduced monouclear cell adhesion and fibronectin prodn and reduced monouclear cell adhesion and fibronectin prodn conscioure; Page 69-72; 91pp; English.

The DNA encoding a portion or (more preferably) the entire pp60 construction or produce increased amounts of pp60 constructions are dotterably to pp60 constructions of the constructions. They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced monouclear cell adhesion. They can also coronary angioplasty, heart bypass surgery, vessel graft and stent implantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ï

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  multi-cloning site.

Disclosure: Fig 4.2: 15pp; Japanese.

The sequence consists of the first 78 bp encoding the N-terminal amino acids of the beta galactosidase gene fused with the lck gene. It is prepd. by a claimed process in which a DNA contg. the lck gene is inserted into an E.Coll expression vector. The vector has DNA contg. part or all of the beta-galactosidase gene at the appropriate site of the multi-cloning site. It is useful for producing an antibody specifically immunoreactive with only a lck gene-derived polypeptide in T cells. The antibody may recognise lck gene-derived polypeptides in human cells.

characterise potential (ant)agonists of rPTKs, study ligand receptor interactions, measure phosphatase activity and identify rPTK ligands
                  identify and characterise potential faut) agonists of TRR
Example 3; Fig12a-9; 148pp; English.

DNA constructs (T51456-58) respectively code for gD.trkA (W11940),

DNA constructs (T51456-58) respectively code for gD.trkA (W11940),

DL.KB (W11941) and gD.trkC (W11942), comprising fusions between
herpes simplex virus glycoprotein D filag polypeptide and human
receptor protein tyrosine kinases (FTKs) trkA, B and C, which are
involved in the interaction between neurotrophins and their target
cells. The gD.trk constructs can be expressed e.g. in dp12.CHO
host cells and used in kinase receptor activation, enzyme-linked
immunosorbent assays (KIRA BLISA) to measure autophosphorylation of
FPTK kinase domains. These assays are used to identify and
   Measuring auto-phosphorylation of

The present invention describes a composition which comprises two antisense oligonuclectides. The first oligonuclectide is specific for a cytoplasmic oncogene or proto-oncogene selected from ras, raf, EGF-1, c-fms, c-ros, c-kit, c-met, c-trk, c-src, c-abl, bcr-abl, c-fgr and c-yes. The second oligonuclectide is specific for a nuclear oncogene or proto-oncogene selected from myc, jun, c-ets, c-fgs, c-myb, B-myb, c-rel, c-vav, c-ski, c-spi, cyclin Dl, PML/RAR alpha , AMLL/MTGB, E2A/prl and ALL-1/AF-4. The composition is used for treating cancer. The combination of antisense oligonucleotides has synergistically enhanced ability to inhibit growth of cancer cells, 403 T; 568 C; 785 G; 403 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ccctggggtctggggcagctggcggtggctagccaggtcgctgcgggggatggtgtacc 1622

The c-abl gene (161864 and 161865) encodes a non-receptor tyrosine kinase that is activated DNA damaging agents. Antisense constructs kinase that c-abl gene can be used to selectively inhibit the expression c-Abl following exposure of cells to a DNA damaging
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                Tricancer composition comprising two anti-sense oligo:nucleotide(s)

- targetting cytoplasmic and nuclear oncogene(s)

- targetting cytoplasmic and nuclear oncogene(s)

- targetting cytoplasmic and nuclear oncogene from the present invention.

The present sequence represents an oncogene from the present invention.

The present invention describes a composition which comprises two antisense oligonucleotides. The first oligonucleotide is specific for a cytoplasmic oncogene or proto-oncogene selected from ras, raf, EGF-1, c-fms, c-ros, c-kit, c-met, c-trk, c-src, c-abl, bcr-abl, c-fgr and c-fms, c-ros, c-kit, c-spi, cytoplasmic oncogene or proto-oncogene selected from myc, jun, c-ets, c-fos, c-myb, B-myb, c-rel, c-vav, c-ski, c-spi, cytoplasmic oligonucleotide is specific for a nuclear oncogene or proto-oncogene selected from myc, jun, c-ets, c-fos, c-myb, B-myb, c-rel, c-vav, c-ski, c-spi, cytoplasmic selected from is used for treating cancer. The composition is used for treating cancer. The composition of antisense oligonucleotides has synergistically enhanced ability to inhibit growth of cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1071
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1191

Antisense RNA molecule that inhibits expression of c-Abl gene
product - useful in Killing malignant cells in cancer, optionally in
Example 9; Page 70-75; 114pp; English.

Example 9; Page 70-75; 114pp; English.

The c-abl gene (F61864 and T61865) encodes a non-receptor tyrosine
Kinase that is activated DNA damaging agents. Antisense constructs
Ainase that is activated by admaging agents. Antisense constructs
Adirected to the c-abl gene can be used to selectively inhibit the
expression c-Abl following exposure of cells to a DNA damaging
agent such as ionising radiation or mitomytch C. When used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
combination with DNA damaging agents, the antisense RNA provides a synergistic cell killing effect useful for killing malignant cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ccgtgaagaccttgaaggacaccatggaggtggaagagttcttgaaagaagctgcag

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for identifying agonists and antagonists, and new recombinant cells for identifying agonists and antagonists, and new recombinant cells and nucleic acid producing trkB, for diagnosis and treatment of neurological disease

Disclosure: Fig 15; 156pp; English.

The sequence is that of potential tyrosine kinase receptor fragment RR-3, isolated from cDNA from human neuroblastoma cell line SY9Y. It may be of use in the treatment of neurodegenerative disease/neurotrauma including motor neuron disorders such as amyotrophic lateral sclerosis, werding-Hoffman disease, chronic proximal spinal muscular atrophy and cuillain-Barre syndrome. It may also be of use in the treatment of neurological disorders associated with diabetes, Parkinson's disease, Alzheimer's disease and Huntington's chorea. See also Q30715-Q30728.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            <u>;</u>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example, Fig 15; 194pp; English.

The present invention describes nucleic acid molecules for ror-1, ror-2, ehk-1 and ehk-2. Also described are the corresponding proteins: Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence encodes rat orphan tyrosine kinase receptor Rtk-3 from the present invention.

Claim 7; Page 49-50; Sapp; English.
This DNA encodes a cytoplasmic tyrosine kinase which has enhanced expression in connection with blood cell differentiation. It was isolated from the human UT-7 blood cell line. The DNA sequences and antibodies raised against the enzyme, are usful for screening agents for inhibiting or activating activity on the tyrosine kinase, for sequence 1942 BP; 85 A; 615 C; 651 G; 311 T;

The present invention describes nucleic acid molecules for ror-1, ror-2, ehk-1 and ehk-2. Also described are the corresponding proteins: Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence encodes human ROR-2. Sequence 4092 BP; 884 A; 1229 C; 1171 G; 808 T;
